West Lie virus
Viruses, SENRA positive-strand viruses, no DNA stage, Flaviviridae,
Flavivirus, Japanese encephalitis virus group.
1 (Dases 1 to 451)
Beasley,D.W., Li,L., Suderman,M.T. and Barrett,A.D.
Mouse neuroinvasive phenotype of West Nile virus strains varies depending upon virus genotype

Kunjin virus

Viruses; seRNA positive-strand viruses, no DNA stage; Flaviviridae;

Viruses; seRNA positive-strand virus group.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                  detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that care not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detected. The hybridisation assay probes and the kits are useful in flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus, that may be present in a biological sample. West Nile virus, thumans and horses serving as incidental hosts. Infection of humans can lead to meniagities or encephalities. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related

This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus, that may be present in a biological sample. West Nile virus, that may and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New hybridization assay probe comprising target-complementary sequence bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hybridisation assay probe; nucleic acid detection; target-complementary sequence; flavivirus; West Nile virus; WNV; NA virus; infection; meningitis; encephalitis; high throughput screening; probe; ss.

ó
oirds and culex mosquitos, with humans and horses serving as incidental notes. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental
                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                       hybridisation assay probe; nucleic acid detection; target-complementary sequence; flavivirus; West Nile virus; WNV; RNA virus; infection; meningitis; encephalitis; high throughput screening; probe; ss.

The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel method for analysing a target nucleic acid sequence in a biological material. The method comprises adding at least two nucleic acid primers that hybridise under stringent conditions to predetermined nucleic acid sequences of the target nucleic acid sequence that are separated by at least 750 nucleic acid residues, amplifying the target nucleic acid sequence by PCR, and detecting and quantifying the target nucleic acid sequence. The methods and compositions of the present invention are useful for analysing a target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nucleic acid sequence in a biological material by real time PCR using nucleic acid primers that are separated by at least 750 nucleic acid residues in the target sequence. This polynucleotide sequence represents the genomic DNA of a West Nile virus used in the target analysis method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Analyzing a target nucleic acid sequence in a biological material by retime PCR using nucleic acid primers that are separated by at least 750 nucleic acid residues in the target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 10945 BP; 2999 A; 2457 C; 3143 G; 2346 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to a method of determining (MI) level of potentially active biological pathogens in biological material, adding at least two nucleic acid pathogens in biological pathogens and adding at least two nucleic acid sequences by PCR, and detecting and adding at least two nucleic acid sequences, where quantity for the nucleic acid sequences is proportional to number of biological pathogens in a blood or blood components, proteins, extensives, internal connections, bear to acid, ligaments, tendons, nerves, bone, teeth, skin grafts, bone marrow, heart valves, cartilage, corneas, arteries, veins, organs, camples, mummified material, human or animal remains, steen calls, instead and tenders and the connection of tangerhans cells, cells for transplantation, red blood cells, white blood cells or platelets. The biological pathogen is chosen from Aspergillus (campiloacter, Halicobacter, The biological pathogen is chosen from Aspergillus, Campiloacter, Halicobacter, Listerial, and the connection of the control of the cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    evaluation of the effectiveness of sterilization processes, and determination of both the original level and the residual level of potentially active biological pathogens. This sequence corresponds to a West Nile virus DNA detected by the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                               Determining level of potentially active biological pathogens in biological material, by adding nucleic acid primer pairs to biological material, amplifying target nucleic acid by PCR, detecting and

The method comprises: contacting a sample from the subject or animal host. The method comprising a flavivirus a sample protein domain III polypeptide (ADKI3683-ADKI3701) under conditions that permit formation of specific immunocomplex between an antibody in the sample and the envelope protein domain III polypeptide; and detecting whether a specific immunocomplex is formed. The present sequence is the conding sequence for West Nile Virus protein, from which E protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing flavivirus infection by contacting a sample from a human or animal with a flavivirus envelope protein domain III polypeptide, and detecting formation of a immunocomplex between the envelope protein and

New diagnostic kit comprising West Nile Virus (WNV) envelope protein reactive with antibody against WNV and cross-reactive with antibody against a flavivirus, useful in diagnosing flavivirus infection caused by DENV, WNV, JEV or SLEV.
                                                                                                                                                                                                                    ds; West Nile Virus; envelope protein; glycoprotein E; flavivirus;
Japanese encephalitis virus; Dengue virus; St Louis encephalitis virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a diagnostic kit comprising at least one isolated and purified polypeptide comprising a West Nile Virus (WNV) envelope (E) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with antibodies against WNV and cross-reactive with antibodies against the diagnostic kit is useful in diagnosing flavivirus and infection caused by DENV, WNV, JEV or SLEV. This sequence corresponds the complete nucleotide sequence of the WNV isolate 2741.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 10975 BP; 3007 A; 2460 C; 3149 G; 2359 T; 0 U; 0 Other;

The present invention relates to a method for identifying compounds (I) that can stimulate a gene of the OAS (2'-5'-oligoadenylate synthase) a culture of cells from a non-human mammal (Plvr/Plvr or Flvr/Plvs; creating cells from a non-human mammal (Plvr/Plvr or Flvr/Plvs; indicating resistance or sensitivity to Flavivirus infection); (b) creating cells with test compound; and (c) measuring activity of OAS gene relative to a control. (I) are potentially useful as antiviral agents for treating infections by Flaviviruss (e.g. hepatitis C; dengue; yellow creating infections by Flaviviruss (e.g. hepatitis C; dengue; yellow control and various forms of encephalitis). Genomic OAS DNA and derived control (b) in screening for anti-flavivirus agents, and (c) for evaluating sensitivity of subjects to Flavivirus infection and their circlisk of developing severe forms of such infections. The present sequence is west Nile Virus strain NY99-flamingo 382-99 (IS-98-STI) complete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     genome, which was used in an example from the invention. West Nile Virus
                                                                                                                                                                                                                                                                                                                                                                                                      Identifying stimulators of oligoadenylate synthase family genes, useful as antiviral agents against Flavivirus, also mutated genes responsible for sensitivity to virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ds; West Nile Virus; envelope protein; glycoprotein E; flavivirus;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents the genome of a strain of West Nile virus (WNV), designated IS-98-STI. This strain is a neuroinvasive and neurovirulent strain of WNV. Polymucleotides and polypeptides derived from the IS-98-STI genome are useful for diagnosis and prognosis of Flavivirus infection, specifically WNV-mediated encephalitis. They are also useful to raise specific antibodies, for recombinant expression of WNV proteins or peptides (for diagnosis, production of antibodies and identification of specific binding partners in cells), for identifying cellular genes implicated in resistance to viral infection, and for screening for anti-Flavivirus agents

This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a straget-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to menigities or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         hybridisation assay probe; nucleic acid detection; target-complementary sequence; flavivirus; West Nile virus; WNV; RNA virus; infection; meningitis; encephalitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        t
                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a diagnostic kit comprising at least one isolated and purified polypeptide comprising a West Nile Virus (WNV) envelope (B) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with antibodies against WNV and cross-reactive with antibodies against a flavivirus. The diagnostic kit is useful in diagnosing flavivirus flavietion caused by DENV, WNV, JEV or SLEV. This sequence corresponds the complete nucleotide sequence of the WNV isolate 3356.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                           ö
                             This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus, that may be present in a biological sample. West nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, BEV cDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present invention relates to a genomic RNA of the Korean Japanese

The JEV genomic RNA, JEV cDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.

The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV cDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV CDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (WTR) and a single polypeptide coding region. The JEV genomic RNA, JEV cDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV cDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New Japanese encephalitis virus genomic RNA, useful in developing vaccines for and in diagnosing and treating Japanese encephalitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV cDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New Japanese encephalitis virus genomic RNA, useful in developing vaccines for and in diagnosing and treating Japanese encephalitis

This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a traget-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus, that may be present in a biological sample. West nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningities or encephalitis. The invention may allow for accurate and efficient high throughput screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (GENP-) GEN-PROBE INC.

                                                     Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, BEV cDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                            invention relates to a genomic RNA of the Korean Japanese

This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a traget-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus, that may be present in a biological sample. West not seam to the number of the number of numbers of nucleic acid seems in a biological sample. West nile virus, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                     New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WAV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note== "OTHER= 2'-methoxyethoxy (2'-MOE) nucleotides"

This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus, that may be present in a biological sample. West mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
    New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex megatices, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a number of isolated Arabidopsis thaliana cDNA sequences and their encoded proteins which are especially transcription factor related cDNA's and proteins. The isolated or recombinant plant transcription factor polymucleotides and polypeptides are useful in producing transgenic plants with commercially valuable properties, i.e. modified or altered desirable traits as compared to a reference plant, guch as an alteration in a plant growth characteristic, e.g. growth rate, flower senescence. Sequence information related to the polymucleotides and polypeptides can also be used in bioinformatic search methods. The transgenic plant is useful for growing a progeny plant from a parent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New plant transcription factor polynucleotides and polypeptides, useful in producing transgenic plants with commercially valuable properties, such as an alteration in a plant growth characteristic, e.g. growth rate
                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ds; transcription factor; transgenic plant; growth rate; senescence; seed germination rate; plant vigor; seedling vigor.
